Project ALERT

Review by The National Registry of Evidence-based Programs and Practices (NREPP)

Date of Review: December 2006

Project ALERT is a school-based prevention program for middle or junior high school students that focuses on alcohol, tobacco, and marijuana use. It seeks to prevent adolescent nonusers from experimenting with these drugs, and to prevent youths who are already experimenting from becoming more regular users or abusers.

Based on the social influence model of prevention, the program is designed to help motivate young people to avoid using drugs and to teach them the skills they need to understand and resist pro-drug social influences. The curriculum is comprised of 11 lessons in the first year and 3 lessons in the second year. Lessons involve small-group activities, question-and-answer sessions, role-playing, and the rehearsal of new skills to stimulate students' interest and participation. The content focuses on helping students understand the consequences of drug use, recognize the benefits of nonuse, build norms against use, and identify and resist pro-drug pressures.

| Settings                     | Rural and/or frontier, School, Suburban, Urban |
| Implementation History       | Two major evaluations of Project ALERT have been undertaken, both by Dr. Phyllis Ellickson and colleagues at RAND Corporation. The first major evaluation (data set 1) involved 30 middle schools in eight urban, suburban, and |
rural communities in California and Oregon. The schools were randomly assigned to two treatment conditions (teacher-led, teacher plus teen leaders) and one control condition. The second major evaluation (data set 2) involved 55 middle schools in South Dakota, representing a wide variety of Midwestern communities. These schools were randomly assigned to one treatment and one control condition. Broad dissemination of Project ALERT began in 1995. Since then, more than 42,000 teachers have been trained to deliver the intervention in an estimated 3,500 U.S. school districts.

| Replications | This intervention has been replicated. (See Replications section below) |
| Adaptations | Project ALERT curriculum materials are available in Spanish. A Peer Teen Leader Component also is available and can be downloaded free of charge from the Project ALERT Web site (http://www.projectalert.com/). This implementation approach involves high school students in the delivery of the middle school program. Overall, Project ALERT is designed to be adaptive to the background and experiences of students in each classroom and to the changes in the broader social and cultural climate that surrounds them. Because the curriculum is highly participatory (students are asked questions and are involved in group activities and skits), it can vary from one classroom to another. Teachers are trained to respond to the changing input and feedback of students over time and from group to group. Designed adaptation therefore can take place in the hands of adept teachers. |
| Adverse Effects | The most committed smokers reacted negatively to an early version of the curriculum, smoking more than their counterparts in the control condition. In response to this observed boomerang effect, the curriculum was revised to include a smoking cessation lesson designed to bring these more committed smokers back into the classroom psychologically and to improve their response to the program. Results show that the revised curriculum (the only version that has ever been distributed to schools) has no adverse effects and, in fact, has a positive impact on these high-risk early smokers. |
| Public or Proprietary Domain | Proprietary |
| Costs | The entire Project ALERT curriculum and training package |
is $150 per educator. This fee includes all materials needed for implementation (14 lesson plans, 8 interactive student videos in DVD or VHS format, 12 full-color classroom posters), unlimited access to online training and resources, toll-free phone support, an ongoing newsletter subscription to the ALERT Educator newsletter, and unlimited ability to download additional copies of lesson plans. Complimentary on-site workshops are available for school districts or coordinated groups ordering 25 or more Project ALERT curriculum and training packages. The lesson plans include a limited number of formatted student handouts, ready for duplication.

### Outcome 1: Substance use (alcohol, tobacco, and marijuana)

#### Description of Measures
For alcohol, cigarettes, and marijuana, student questionnaires asked about lifetime use, frequency of use within the past month and year, and the amount used. Students were also asked if they had suffered negative consequences due to the use of these drugs (e.g., missed school, did something they later felt sorry for, got into trouble at home or at school).

#### Key Findings
In multiple randomized control group studies, Project ALERT produced lasting outcomes for participants from a variety of ethnic and economic backgrounds who were at low, moderate, or high risk for alcohol, tobacco, or marijuana use. Overall, Project ALERT was equally effective when taught solely by classroom leaders and when teen leaders were included in classroom delivery.

Analyses at the end of grade 8 (15 months after baseline) assessed students by risk level for future drug use. Among students who had tried neither cigarettes nor marijuana at the beginning of 7th grade, Project ALERT participants were nearly 50% less likely than other students to become current marijuana users by 8th grade. After incorporation of the 8th-grade booster sessions, this figure increased to more than 60%. Project ALERT participants were 30% less likely than other students to begin using marijuana. All of these findings were statistically significant (p < .05).

For alcohol use, Project ALERT initially produced only modest, short-lived reductions. However, the revised Project ALERT, which incorporated additional material on alcohol, reduced the likelihood of alcohol use by 24%. Participants in the revised Project ALERT schools were also less likely to suffer alcohol-related consequences such as fighting and getting in trouble at home or school because of drinking (p < .05). These effects continued into the 8th grade.

The revised Project ALERT curriculum also had preventive effects on alcohol, cigarette, and marijuana use among students who had tried these substances by 7th grade (p < .05).

Outcome 2: Attitudes and resistance skills related to alcohol, tobacco, and other drugs

**Description of Measures**
This outcome was measured by student surveys. The surveys inquired about risk and protective factors such as student awareness of consequences of substance use, beliefs about the prevalence of substance use and its acceptability to others, resistance self-efficacy, and expectations of substance use in the next 6 months.

**Key Findings**
In multiple randomized control group studies, analyses of program effects on attitudinal risk factors showed that Project ALERT dampened prodrug beliefs about cigarette and marijuana use (low resistance self-efficacy, low perceived consequences of use, tolerance of drugs, expectations of future use, and low estimates of peer drug use). Effect sizes for beliefs about cigarette and marijuana use, calculated as the standardized adjusted mean difference between groups, were small for all students combined (0.07-0.17) and for students at different risk levels (0.07-0.27). The curriculum had a more limited impact on beliefs about alcohol.

Although Project ALERT's effects on drug use dissipate in high school, its effects on knowledge and beliefs persist during the high school years. In 10th grade, former ALERT participants were more likely than other students to believe that drug use has negative social consequences and produces dependency, that resistance has benefits, and that fewer peers use and approve of use. Effects on beliefs about the risk of dependency, social consequences of use, and lower peer use continued into 12th grade.

**Study Strengths:** The measures and items are well described based on extensive literature review. Most items have been commonly and successfully used in previous research. The items were adjusted for the age of respondents, and five survey versions were pretested. The use of saliva cotinine for truth in tobacco reporting was excellent.

The materials reviewed describe extensive measures to ensure intervention fidelity, including a teacher guide and checklist, and monitoring forms to document further support. Steps were taken to minimize attrition and account for missing data and the developers conducted analyses to assess the impact of attrition. Sample sizes were large. Attrition rates approached 10% but did not surpass this level and therefore were not a threat to internal validity.

Schools were blocked by district, and restricted assignment was used in randomization to enhance comparability between intervention and control schools and minimize potential confounding variables. Intervention effects can be attributed to the Project ALERT intervention outcomes reported in the publications reviewed. Data were analyzed both at the student and school levels and by students' risk levels. Adjustments were made for baseline differences and intraschool correlation.

**Study Weaknesses:** No weaknesses were noted by reviewers.

**Dissemination Strengths:** Implementation materials are comprehensive, well articulated, and cogently structured. The videos and classroom poster realistically depict situations and should be engaging for young adolescents. Implementation materials are also available in Spanish. Videos are closed-captioned for the hearing impaired. The Project ALERT Web site is easy to navigate. On-site training is available both before and during implementation, and training can also be completed online. Fidelity measures, pre- and postintervention measures, and scoring information are provided to support quality assurance.

**Dissemination Weaknesses:** Additional training, support, and/or technical assistance may be required for administrators to support implementation fidelity.
### Study Populations
